Automating Attendance

Addressing Manual Tracking Challenges

AttendAI simplifies attendance management by automating the tracking process, reducing human error and saving time. This innovative system uses **face recognition** technology for efficient attendance recording.

Technology Stack Overview

01

Python

Python is the main programming language used.

03

OpenCV

OpenCV processes images for enhanced accuracy.

02

face_recognition

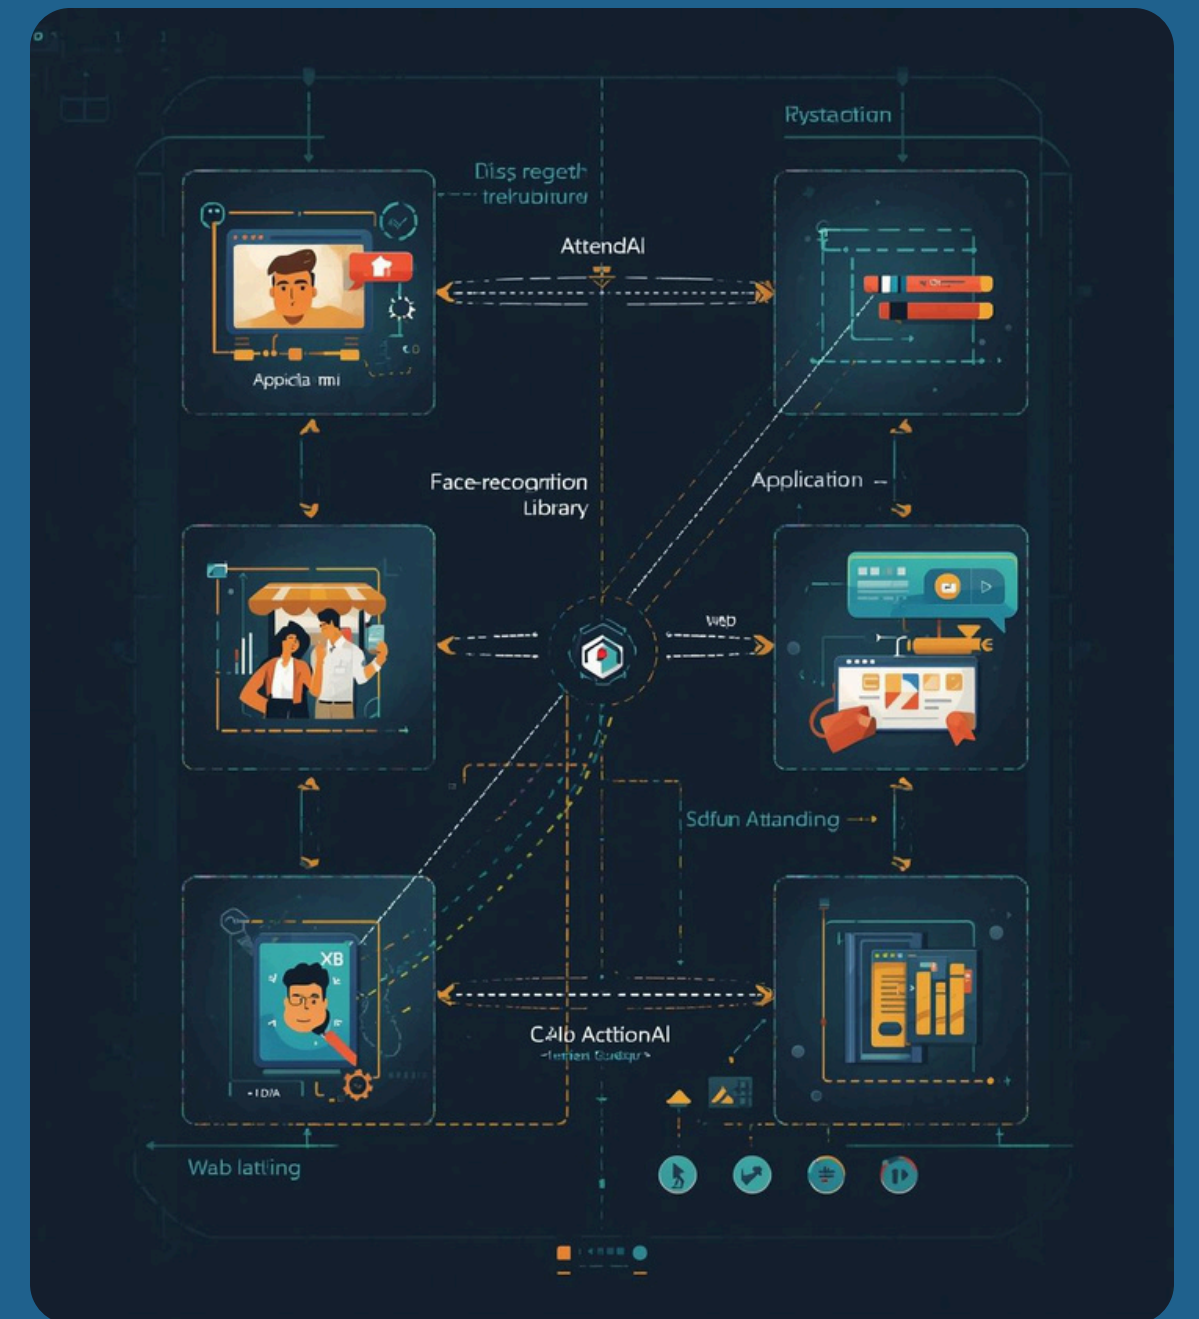

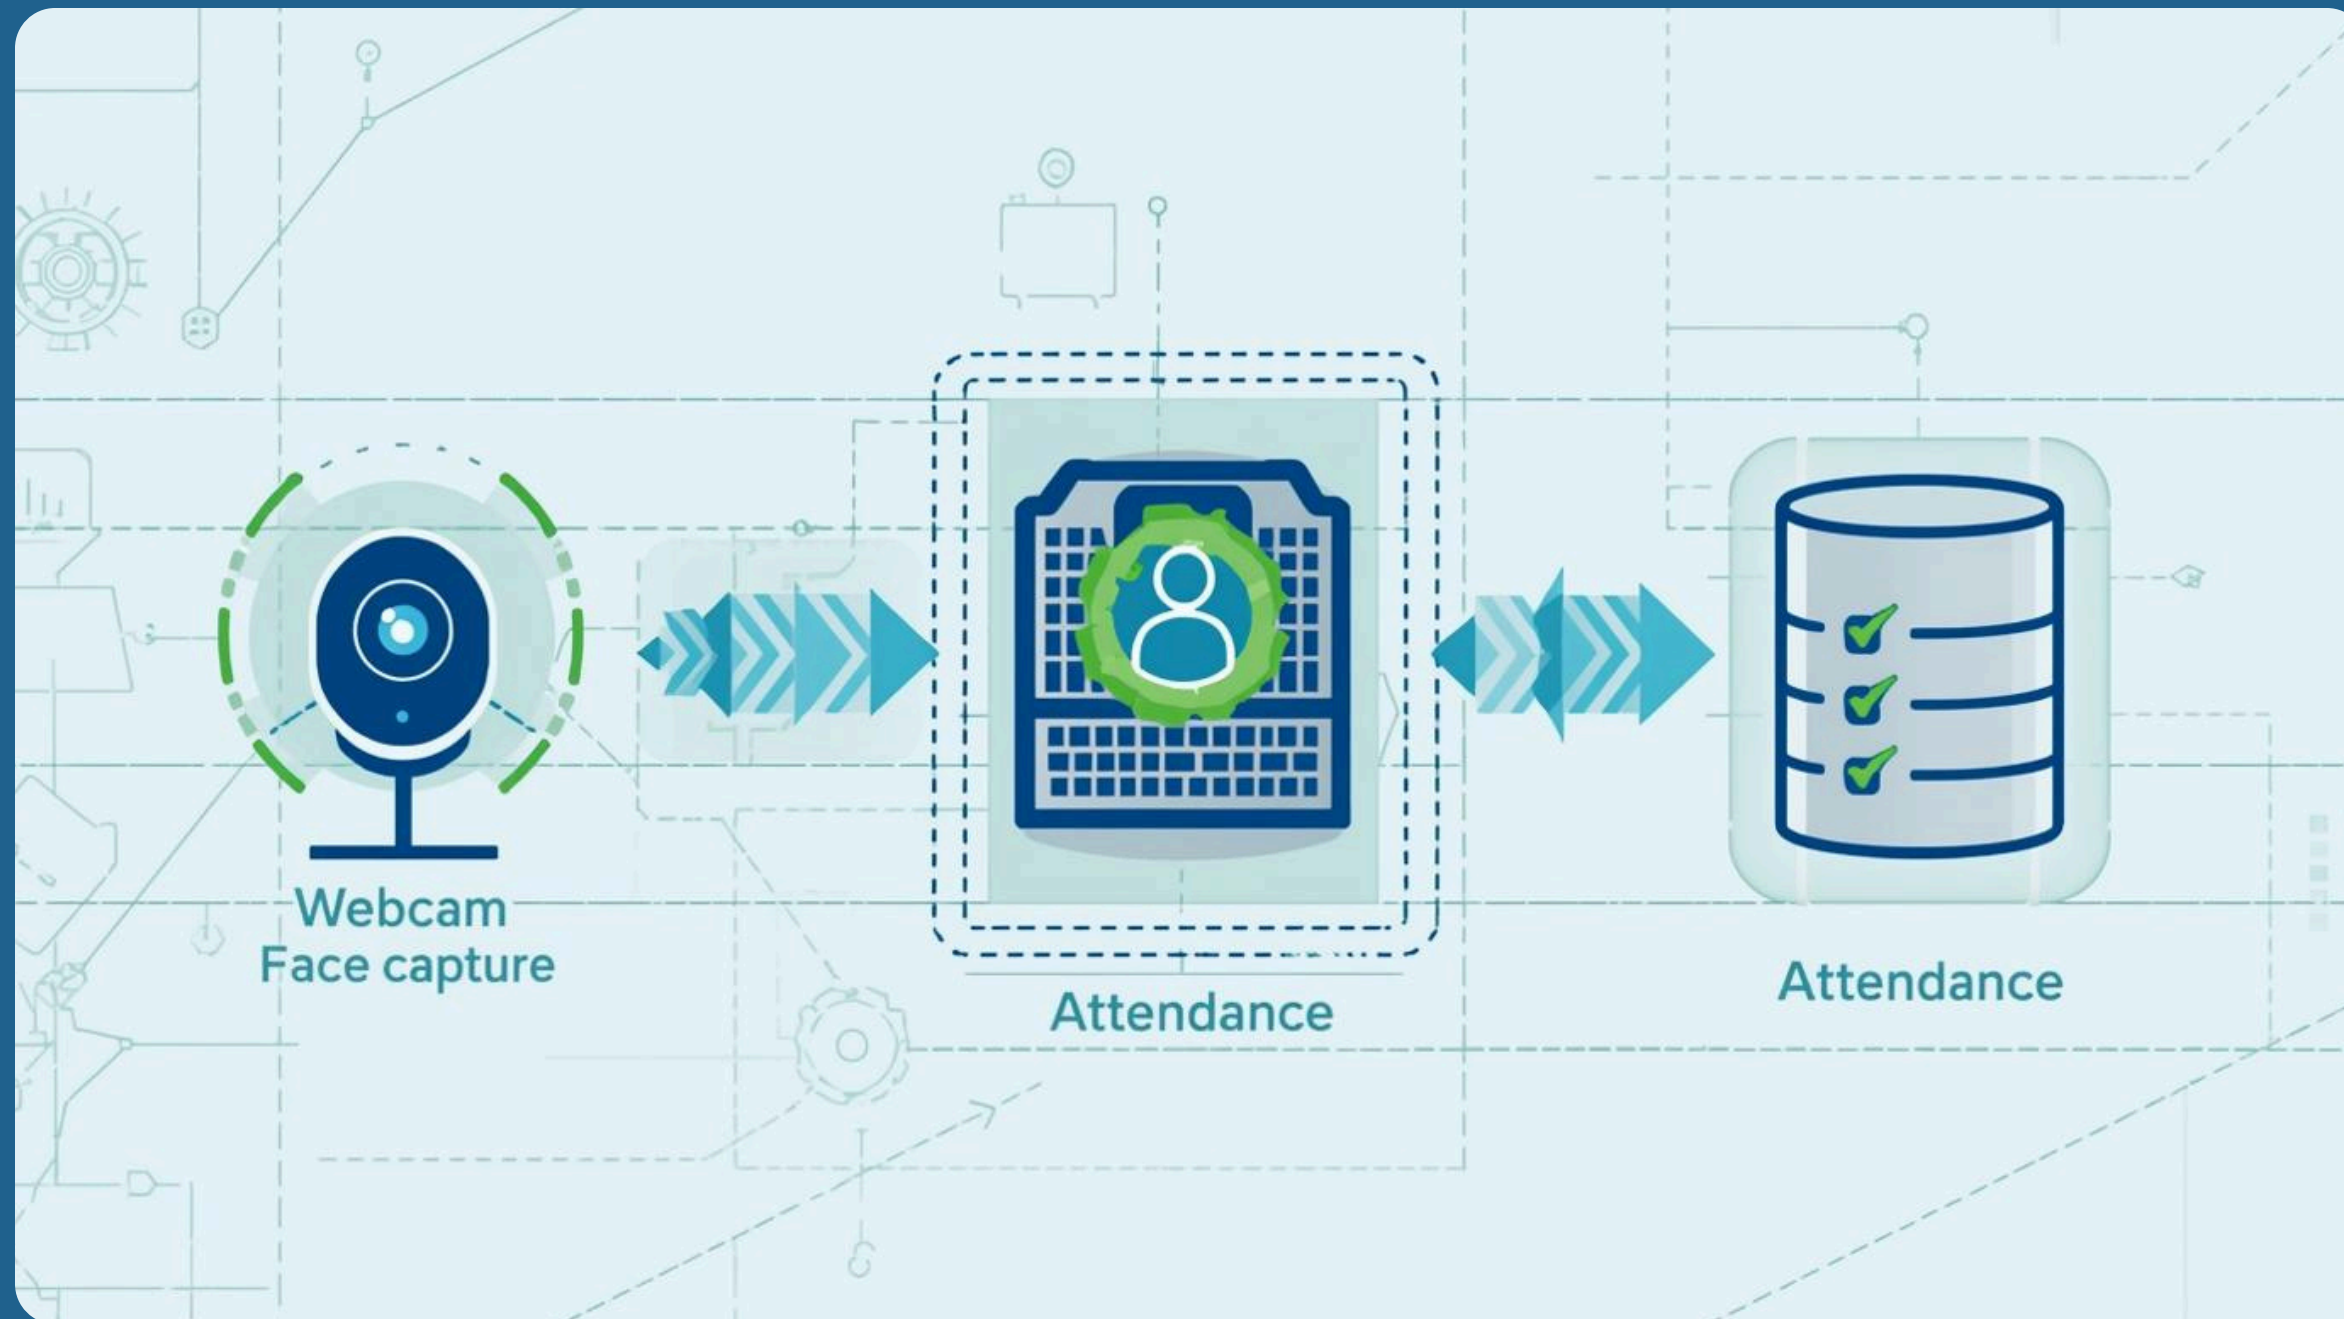

This library enables facial detection and recognition.

04

Flask

Flask is used for building the web application.

AttendAI System Architecture Overview

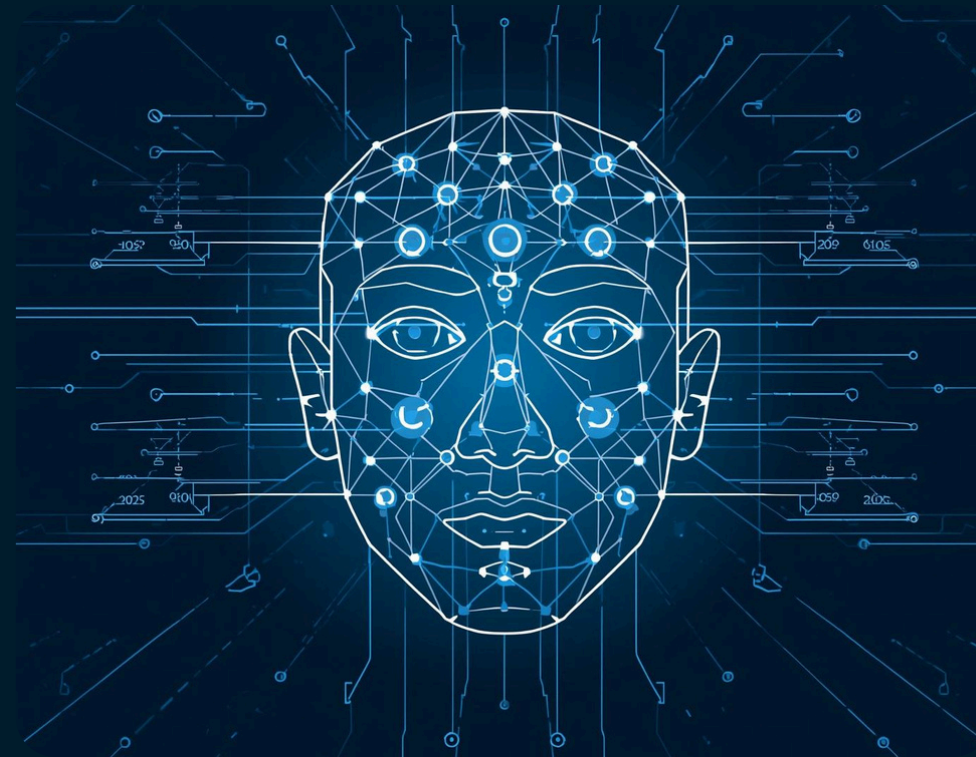

Face Recognition Process

Real-time Capture

The system captures live images of individuals using the webcam in real-time.

Detecting Faces

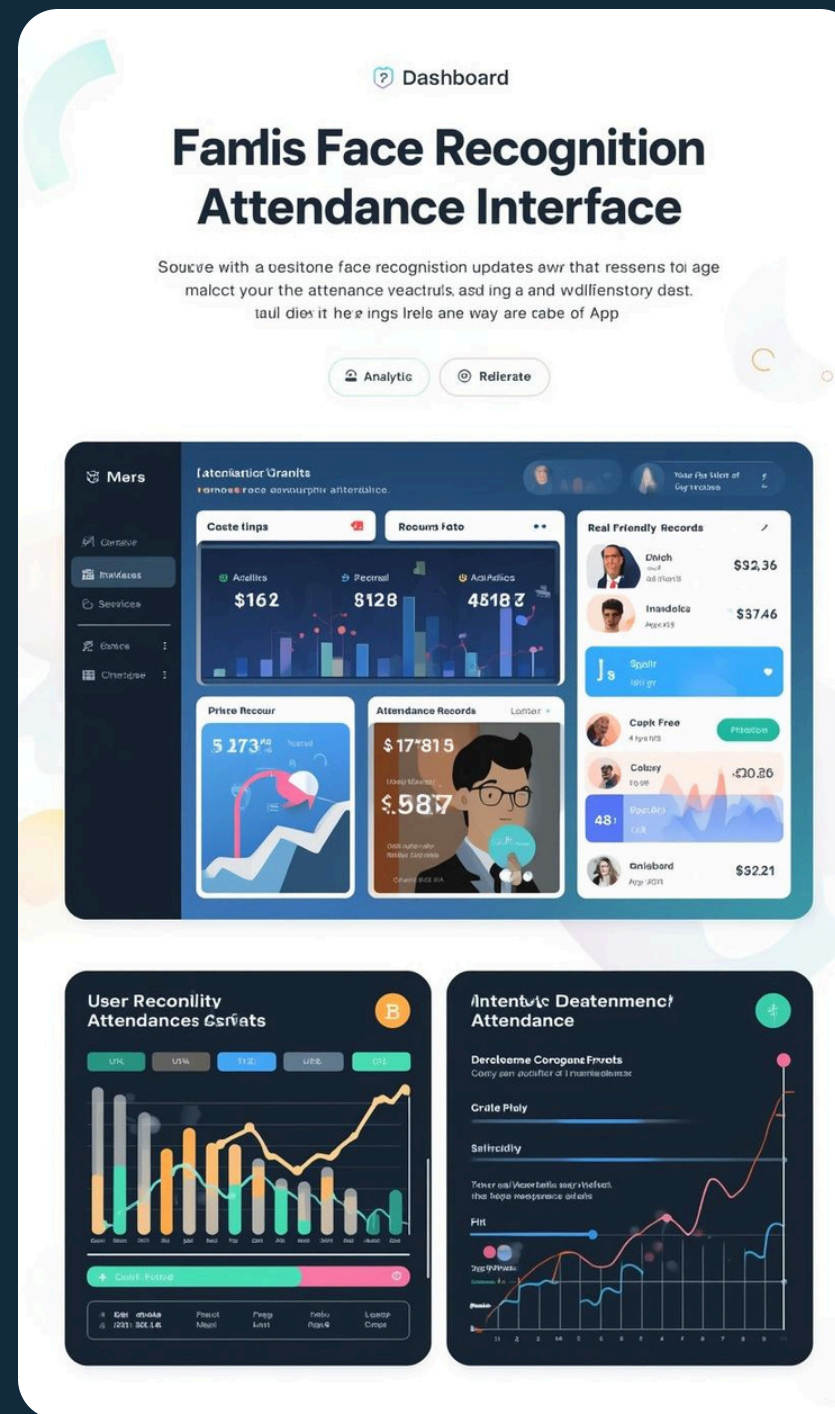

Advanced algorithms detect and recognize faces, ensuring accurate identification during attendance.

Matching Faces

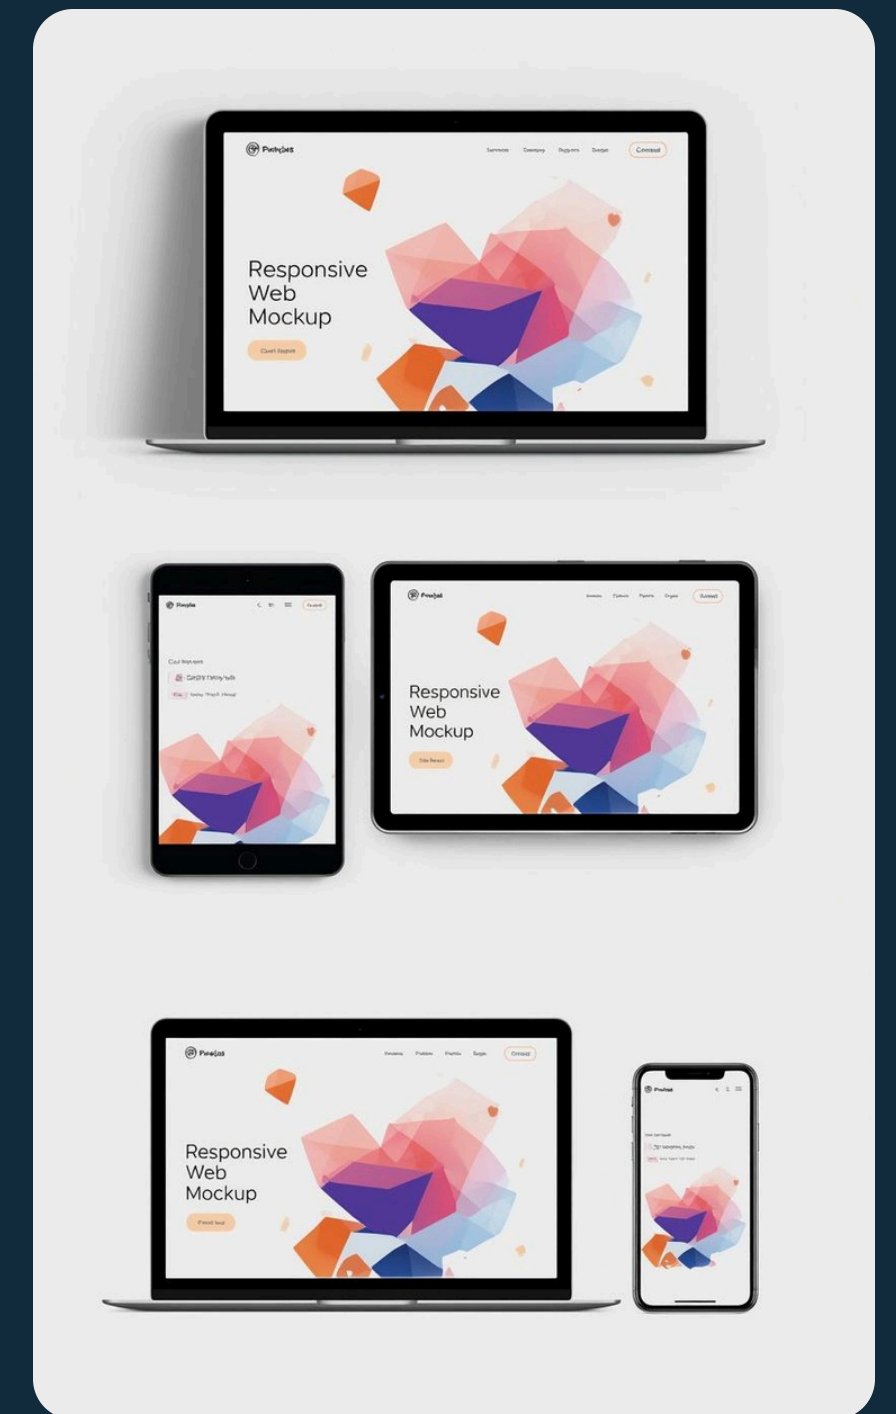

Recognized faces are matched with stored data, ensuring efficient and accurate attendance logging.

User Interface and Design Features

Dashboard

Intuitive user interface for easy navigation.

Responsive Design

Adapts seamlessly to all device types.

Development Process and Benefits

01

Planning

Analyzed requirements and set project goals.

02

Implementation

Developed face recognition features for attendance.

03

Testing

Conducted thorough tests to ensure functionality.

Thank You!
